

IULIAN MALOVANYI

PRODUCT MANAGER

Product Manager with 4+ years of experience in healthcare and software development, and a strong foundation in test automation and quality engineering. Skilled in driving the full product lifecycle, from discovery and roadmap planning through delivery and iteration. Experienced in working across technical and non-technical teams, managing stakeholders, and aligning product strategy with business goals. I have hands-on experience with desktop, mobile, and web applications, as well as working with SaaS apps. Passionate about building innovative solutions that improve efficiency, deliver measurable value, and drive better outcomes.

EDUCATION

2007 - 2009

Kyiv National University of Bio
Resources and Nature Management

Magister in
"Land Management and Cadaster"

2003 - 2007

Kyiv National Agrarian University

Bachelor in
"Geodesy, Cartography and Land Management"

SKILLS

- **Product Management:** Product Strategy, Roadmap Planning, Backlog Management, Prioritisation, Requirements Management, Problem Solving & Decision Making, Market & User Research
- **Leadership:** Cross-functional Team Leadership, Stakeholder Management, Communication, Collaboration, Presentation
- **Delivery:** Software Documentation, Release Planning & Go-to-Market Readiness, Success Metrics Tracking, Data-driven Decision Making
- **Process & Tools:** Agile (Scrum), Jira, Confluence, Figma, Prototyping

WORK EXPERIENCE

Product Manager

C the Signs (Healthcare, UK) | Jul 2021 – Present

As Product Manager at *C the Signs*, I lead the development and delivery of an AI-driven third-party cancer decision support platform, integrated with (EHR) systems existing in the NHS, and used daily by more than 20,000 clinicians. Covering around 30% of NHS practices across the UK, the platform supports both clinical decision-making and patient tracking at scale.

Operating in a highly competitive market, I focus on keeping the product relevant and valuable for customers and users while maintaining high-quality standards. I drive continuous product evolution by gradually introducing new capabilities, guided by business needs, data analysis, user feedback, and real-world usage insights.

Working closely with clinical, engineering, design, support, and sales teams, I ensure the platform empowers healthcare professionals, enhances interoperability, improves efficiency, and ultimately helps save lives, while maintaining high standards of patient data security.

Over the past four years, my responsibilities have spanned multiple areas of product management:

- Lead the full product delivery lifecycle — from initial exploration and alignment through planning, execution, and delivery.
- Experienced in building and launching products from scratch, and driving continuous improvements based on data, insights, and user feedback.
- Owned the product roadmap, aligning releases with product strategy, customer needs, and cross-team priorities.
- Prioritized and managed the product backlog to ensure focus and alignment.
- Led requirements discovery, documentation, and change request management to support clarity and adaptability.
- Collaborated with stakeholders and cross-functional teams to define and refine features, ensuring effective communication and alignment across engineering, design, and business units.
- Managed stakeholders, facilitating clear communication, expectation alignment, and timely delivery of product outcomes.
- Maintained accurate and up-to-date product documentation to ensure transparency and compliance.
- Prepared release notes and facilitated release and rollout processes for new features and products.
- Collected success metrics from business, sales, and clinical teams, monitored outcomes, and used insights to drive continuous product improvements.
- Advocated for customer-centric, data-informed decisions while balancing technical feasibility and business impact.

Quality Assurance Lead

C the Signs (Healthcare, UK) | Jan 2021 – Jul 2021

Led quality assurance for an AI-driven clinical decision support and patient tracking platform used across the NHS to assess cancer risk and support clinicians in daily workflows. This role gave me firsthand experience ensuring that complex, high-impact healthcare products meet the standards required to deliver trust and efficiency at scale.

- Defined the overall test strategy from scratch, creating structured test plans and establishing automation practices.
- Introduced and maintained clear documentation standards, significantly improving transparency and alignment across teams.
- Built the foundation for scalable QA processes, ensuring higher product quality and smoother releases.
- Recognized by leadership for strong organizational and strategic skills, which led to a promotion to Product Manager in July 2021.

Quality Automation Engineer

SoftServe (Enterprise data monitoring and analytics product) | 2019 – 2021

Worked as an Automation Engineer on solutions for a leading U.S.-based enterprise monitoring and analytics provider. The platform helped large organizations track network traffic, detect anomalies, and ensure system reliability. This experience gave me product insight into how automation, monitoring, and data-driven intelligence create value for enterprise customers.

- Automated testing using JavaScript and the Nightwatch framework while working on solutions for a leading big data analytics company based in the USA.
- Designed, implemented, and maintained automated test suites to ensure product quality, data integrity, and system stability.
- Collaborated closely with QA and development teams to streamline testing processes and improve CI/CD pipelines.
- Gained solid experience in Agile environments, applying scripting and automation techniques to optimize workflows and increase testing efficiency.

Quality Control Engineer

SoftServe (Global networking leader, hardware and security monitoring) | 2019 – 2021

This role gave me early exposure to enterprise security products, where I learned how customers rely on networking hardware to safeguard critical infrastructure. It helped me understand product reliability, performance, and security as key value drivers in large-scale solutions.

- Gaining first hands-on experience in software development and quality assurance.
- Designed and executed manual test cases, created and maintained test documentation, and collaborated with developers to identify and resolve defects.
- Participated in performance and regression testing of complex systems, ensuring product stability and reliability.
- Built a solid foundation in the software development lifecycle, defect management, and Agile (Scrum) collaboration within cross-functional teams.
